Why Machine Learning for Design?

Part I

“AI is the New Electricity”

“Just as electricity transformed almost everything 100 years ago, today I actually have a hard time thinking of an industry that I don’t think AI will transform in the next several years.”

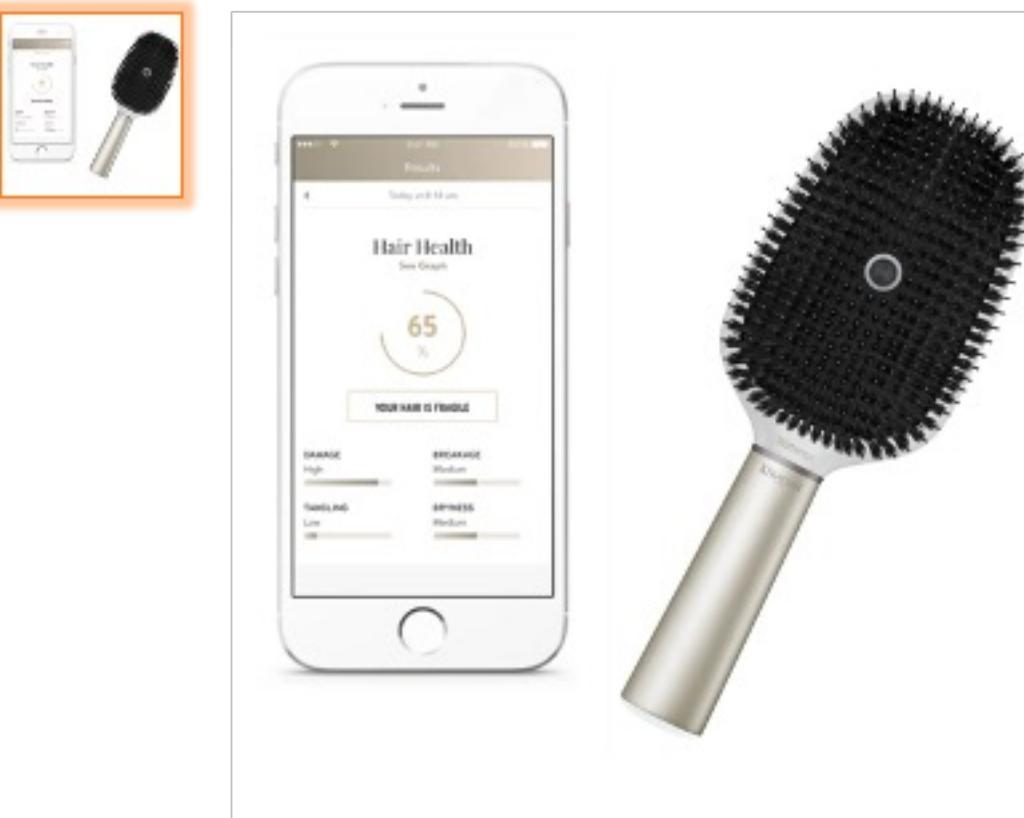

Andrew Ng

Former chief scientist at Baidu, Co-founder at Coursera

<p>Lieneke - Apple image processing</p> <table border="1"> <thead> <tr> <th>Image</th> <th>Description</th> <th>Roles of AI</th> </tr> </thead> <tbody> <tr> <td></td> <td>The Camera application of Apple phones/iPads uses AI in their software to optimize image quality.</td> <td>AI is used to understand the scene (person segmentation, depth estimation) to optimize light and contrast for example. Where is AI? Or ML?

- Autonomous vehicles
 - from Roomba to Self-driving cars
 - In stores, warehouses, production lines, streets, living rooms
- More and more consumer products and appliances
 - Belts!! Really!
 - Thermostats, Security Cameras, Fridges
- Content production and consumption applications
 - Social media, Amazon, Netflix etc.
- Chatbots
- In-store automation and smarter shopping
- Optimised supply chains
- Energy grid optimisation
- ...

Smart hairbrush.
AI splitting the hair...

Price: **\$199.99**

More than just a fashion accessory, Belty Good Vibes is the very first smart belt integrating Artificial Intelligence that contextualizes the activities of your everyday life.

Beyond data

Rather than providing only raw data, Belty offers feedback about the rhythm of your life. It goes beyond statistics and helps you to be more aware of the quality of your everyday experience.

Trust your gut

The abdomen, or belly, is considered the second brain of your body: the home of your gut instinct. Belty Good Vibes empowers you to know yourself better, by reinforcing your ability to connect to your visceral knowledge. Communicating via vibrations with your sense of touch, it plugs you into the present moment.

Good vibrations, great energy

Belty is much more than a smart belt; as wearable, interactive technology, it is your personal coach. We all want to live the best version of our lives. Why not start now?

What is

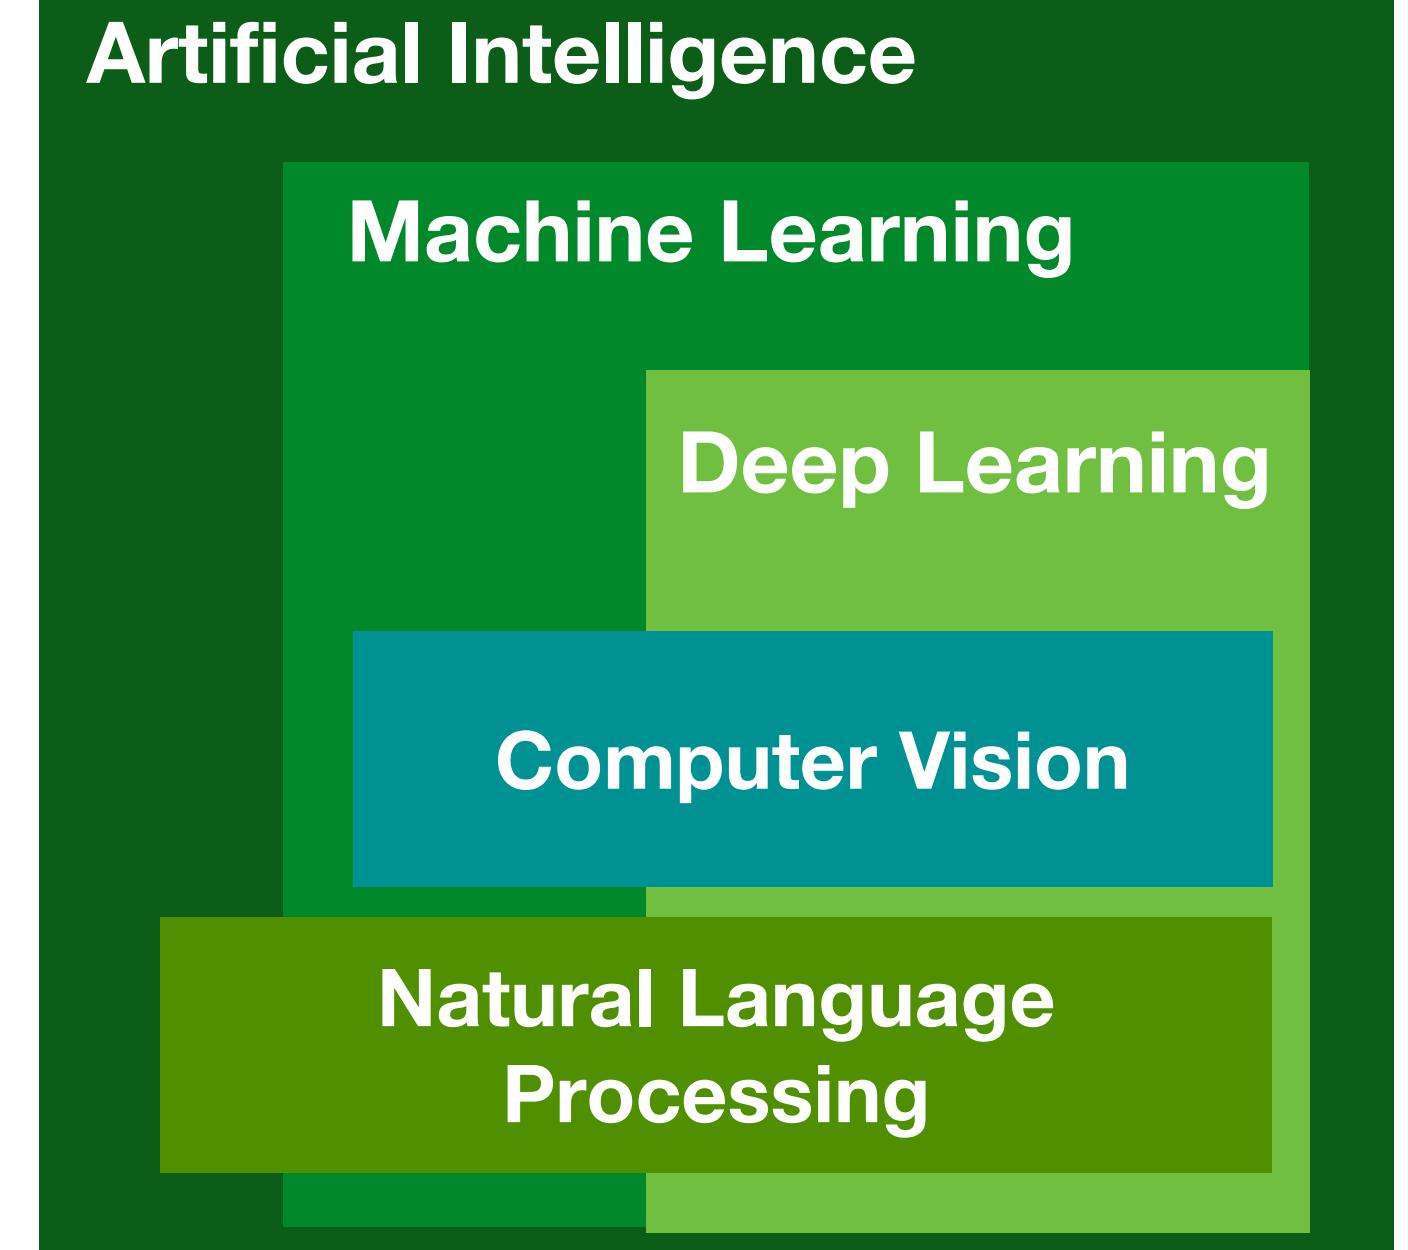

Artificial Intelligence

Machine Learning?

Deep Learning?

Computer Vision?

Natural Language Processing?

Intelligence

- *The ability to learn or understand or to deal with new or trying situations*
- *The ability to apply knowledge to manipulate one's environment or to think abstractly as measured by objective criteria (such as tests)*
- *Mental quality that consists of the abilities to learn from experience, adapt to new situations, understand and handle abstract concepts, and use knowledge to manipulate one's environment*

Merriam-Webster

Encyclopedia Britannica

R. J. Sternberg, quoted in *The Oxford Companion to the Mind*. R. L. Gregory. Oxford University Press, Oxford, UK, 1998

Artificial Intelligence

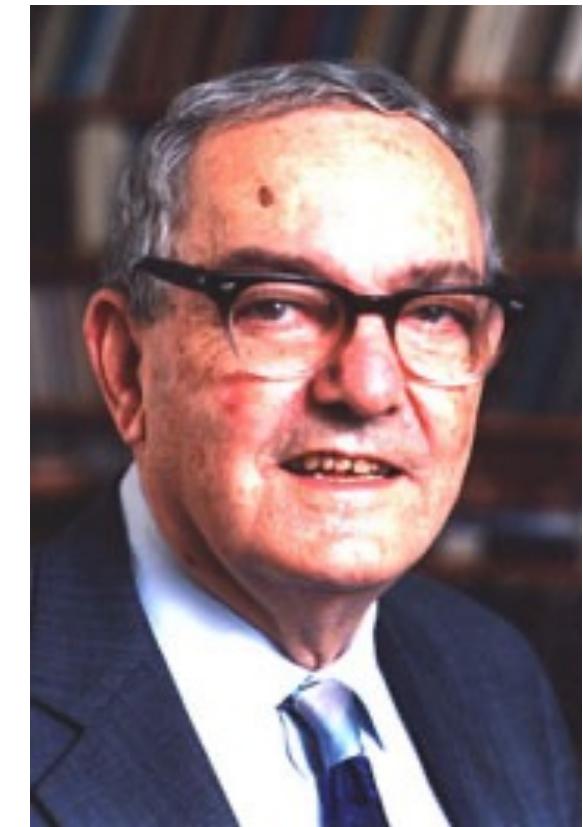

- Intelligence demonstrated by machines
- A branch of computer science that **studies** the properties of intelligence by **synthesizing** intelligence
- Creating computer programs that perform tasks as well as, or better than, humans
 - Perception, Learning, Reasoning, Planning, Problem-solving, Creating

Strong vs. Weak Artificial Intelligence

- **Strong AI**
 - *Artificial General Intelligence* (AGI), human-level, general
 - The AI we see in movies
 - AI that can do everything we humans can do, and possibly much more
- **Weak AI**
 - *Narrow AI*
 - AI specialised in well-defined tasks
 - e.g., speech recognition, chess-playing, autonomous driving
- No AI program has been created yet that could be called intelligent in any general (Strong AI) sense
 - "*A pile of narrow intelligence will never add up to a general intelligence. General intelligence isn't about the number of abilities, but about the integration between those abilities?*
- Superintelligence doesn't really mean anything - a basic calculator far exceeds any human benchmark for performing basic arithmetic

Learning

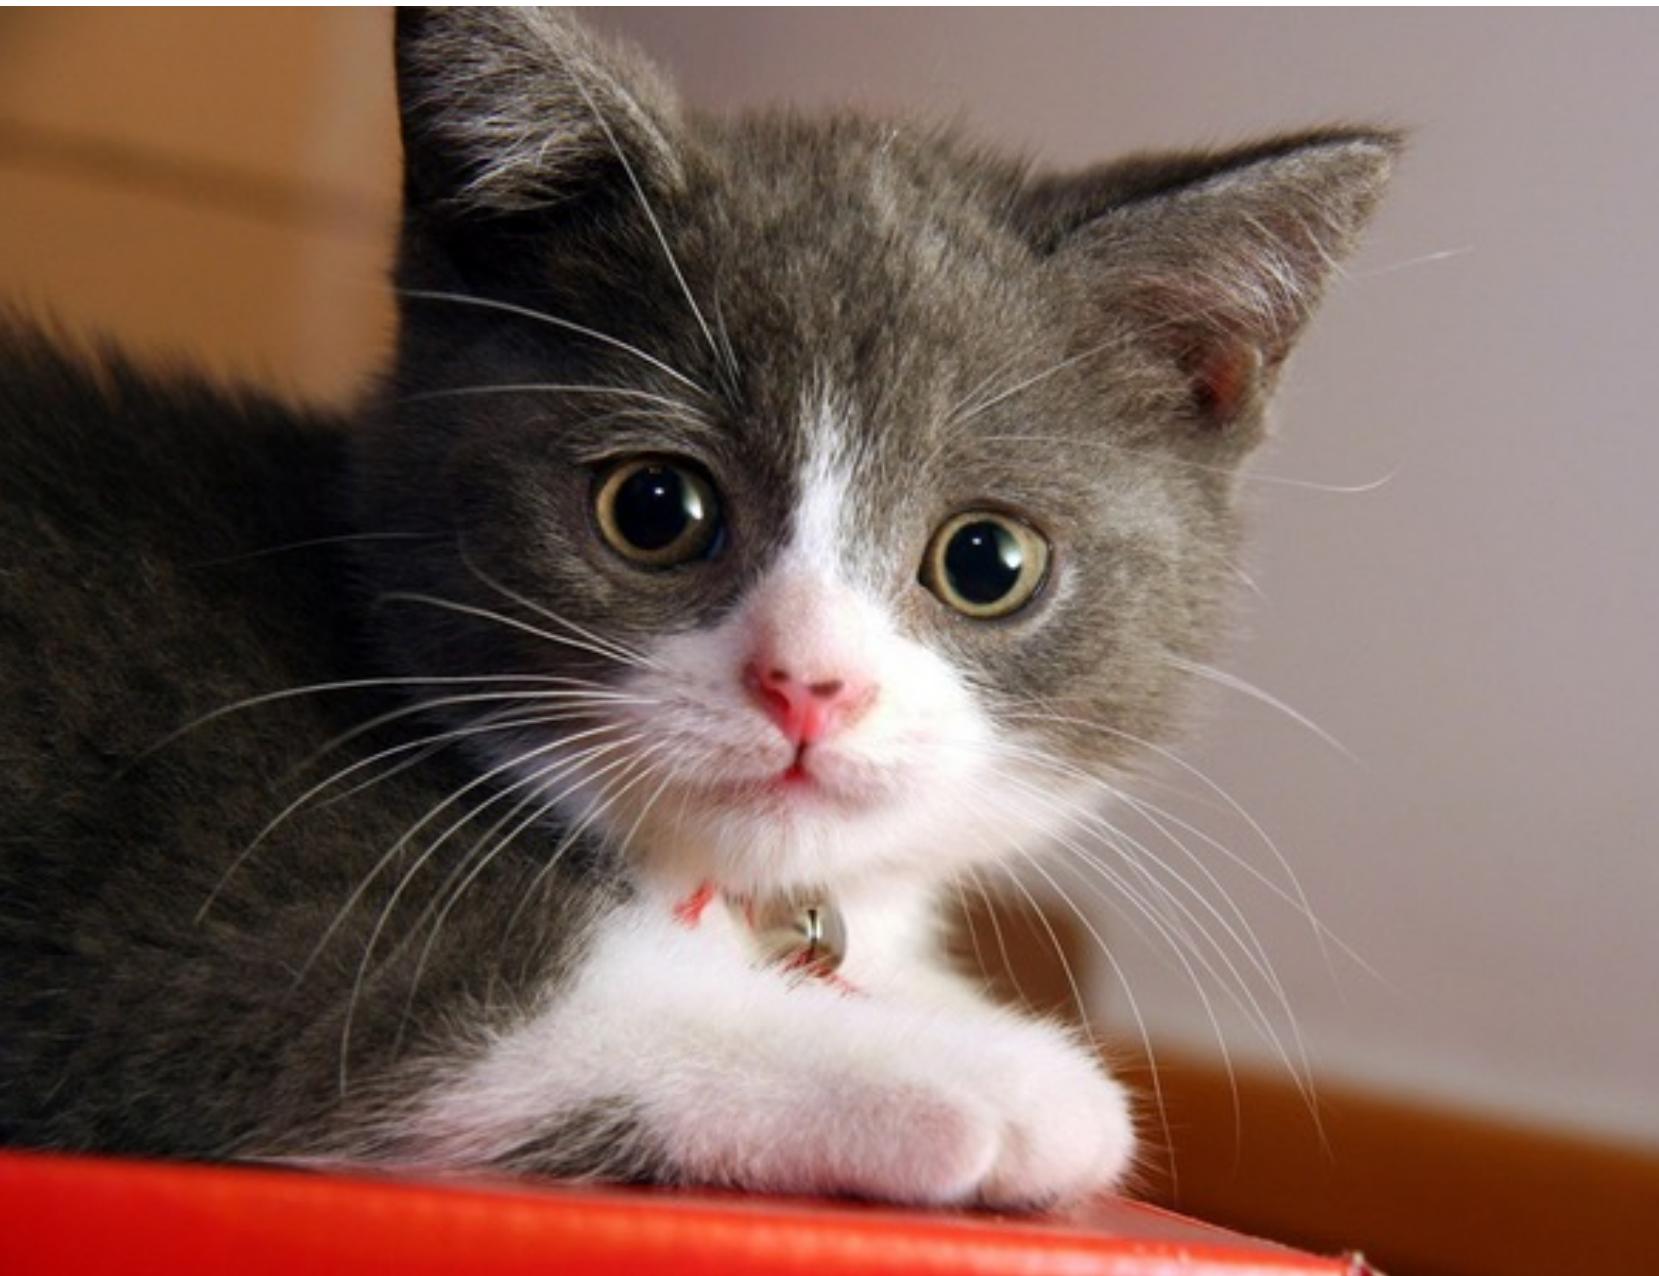

- Any process by which a system improves performance from experience
- Denotes changes in the system that are adaptive in the sense that they enable the system to do the task or **tasks drawn from the same population** more efficiently and more effectively the next time
- The ability to perform a task in a situation that has never been encountered before
- **Learning = generalisation**

Herbert A. Simon

What is a cat?

What is a cat?

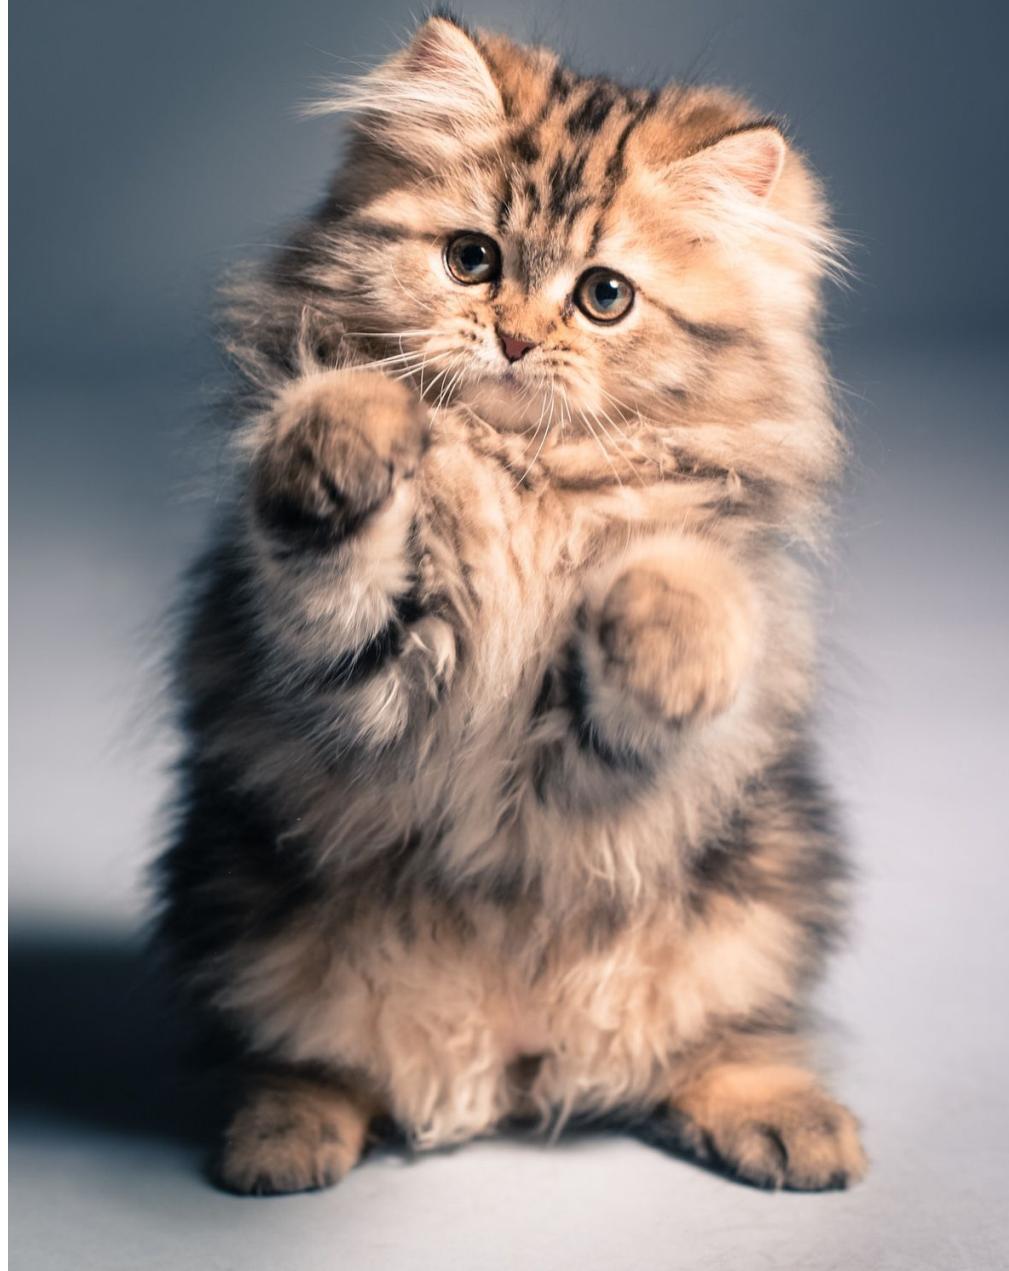

What is a cat? V1

- It's a cat if it has whiskers
- And it is furry

What is a cat?

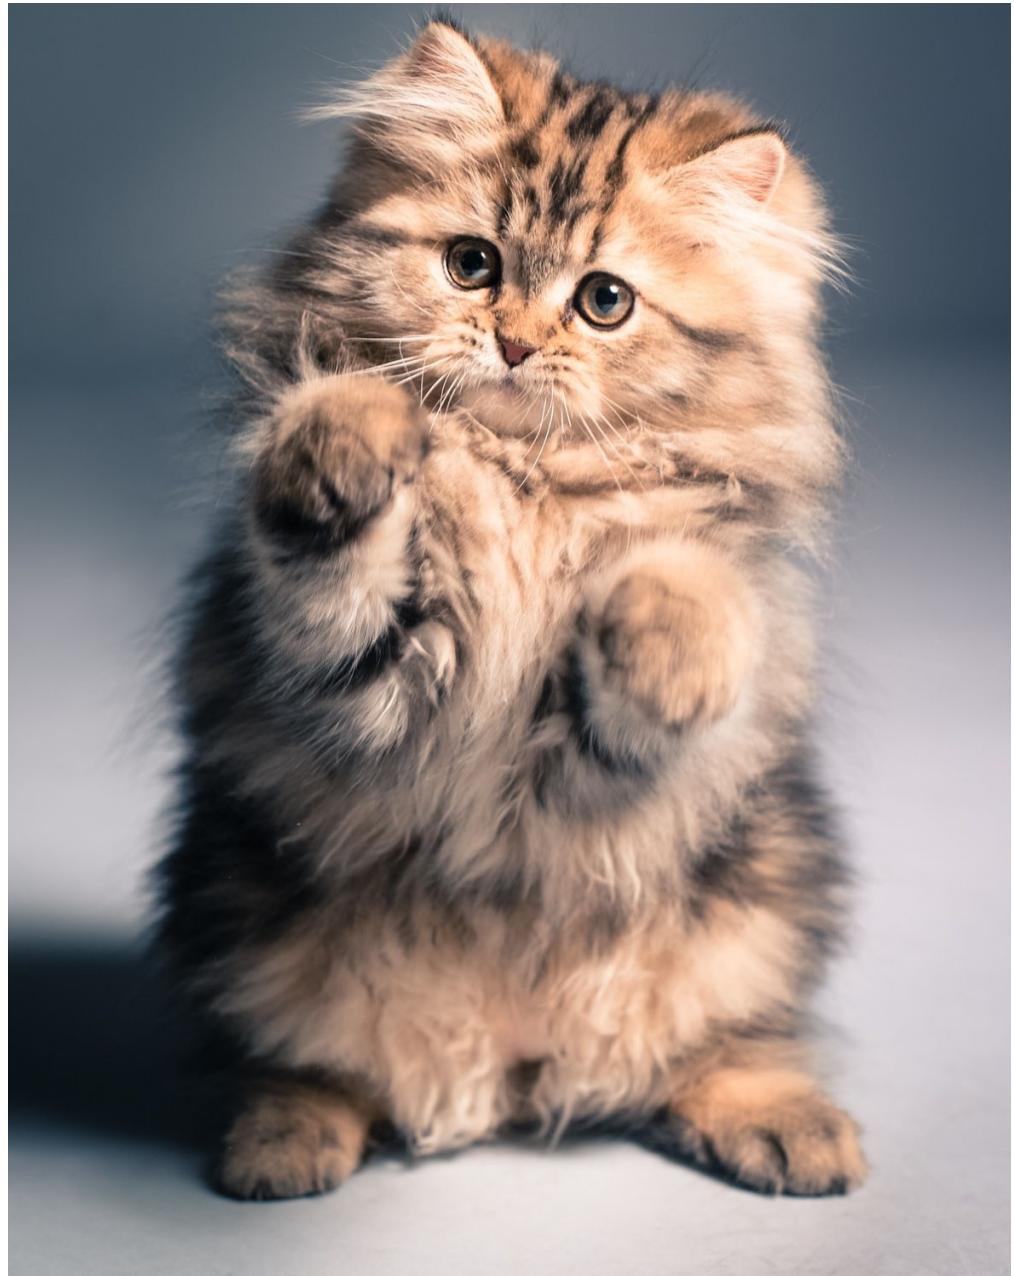

- It's a cat if it has whiskers
- And it is furry

What is a cat? V₂

- It's a cat if it has whiskers
- And it is furry
- And it is small

What is a cat?

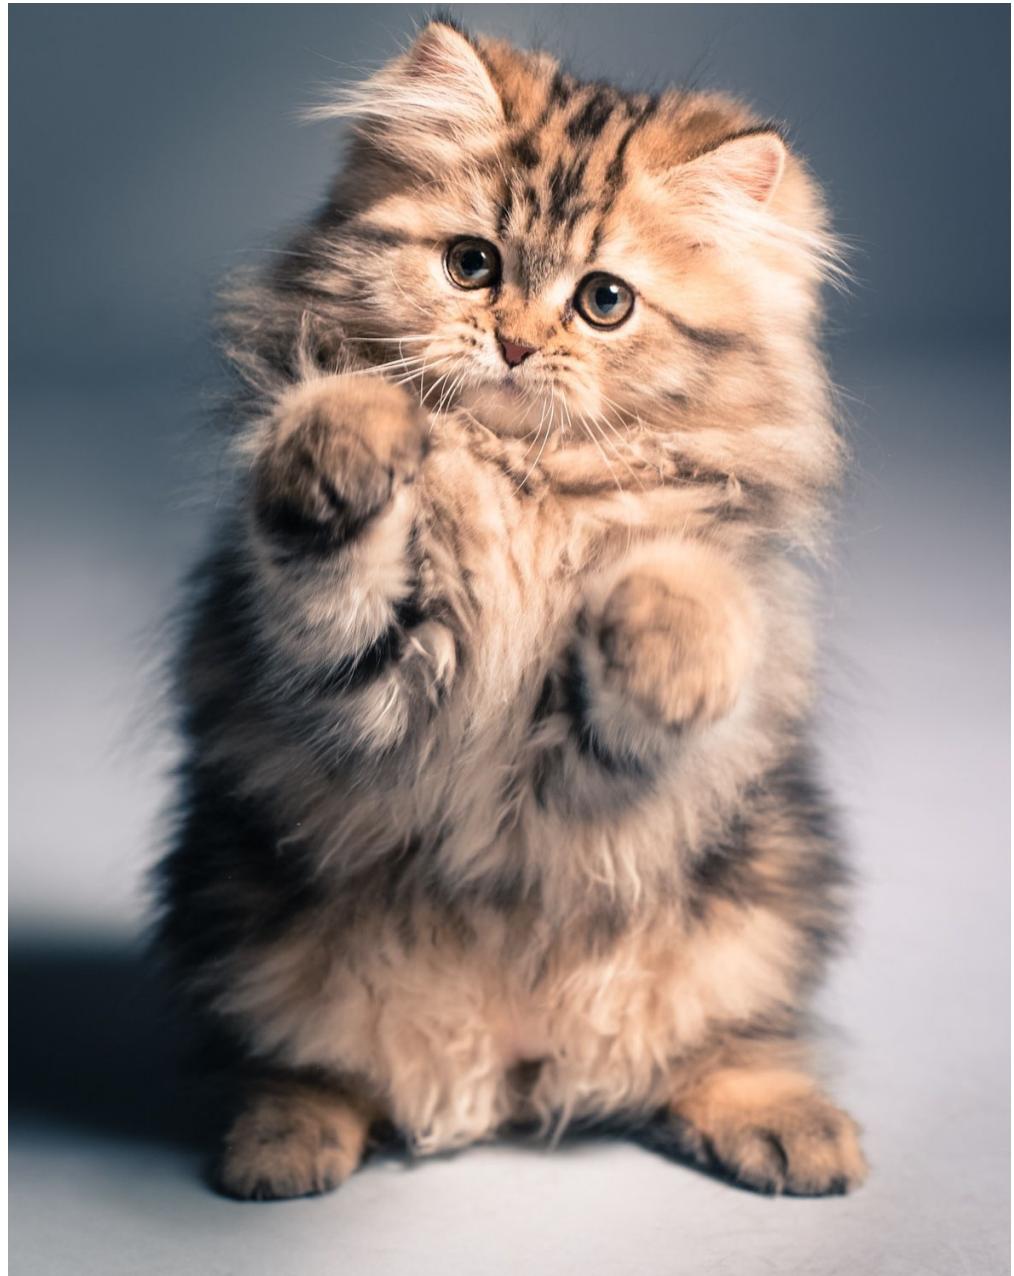

- It's a cat if it has whiskers
- And it is furry
- And it is small

What is a cat? V₃

- It's a cat if it has whiskers
- And it is furry
- And it is small
- And it does not climb trees

What is a cat?

- It's a cat if it has whiskers
- And it is furry
- And it is small
- And it does not climb trees

Polanyi's Paradox | Michael Polanyi (1966)

“We can know more than we can tell...

The skill of a driver cannot be replaced by a thorough schooling in the theory of the motorcar”

Michael Polanyi (1966)

Machine Learning

- *The field of study that gives computers the ability to learn **without being explicitly programmed***

Arthur Samuel

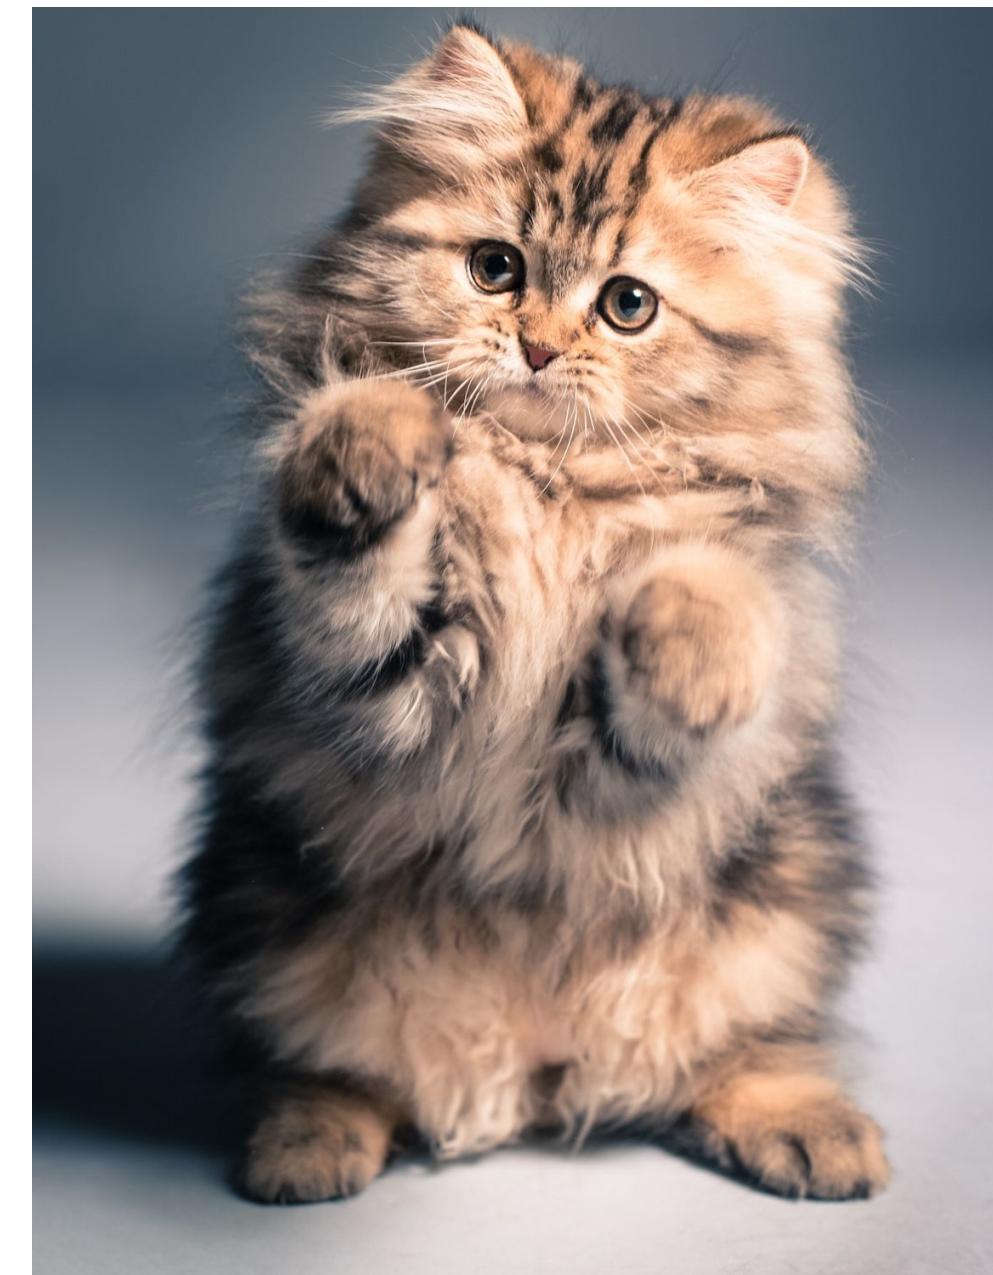

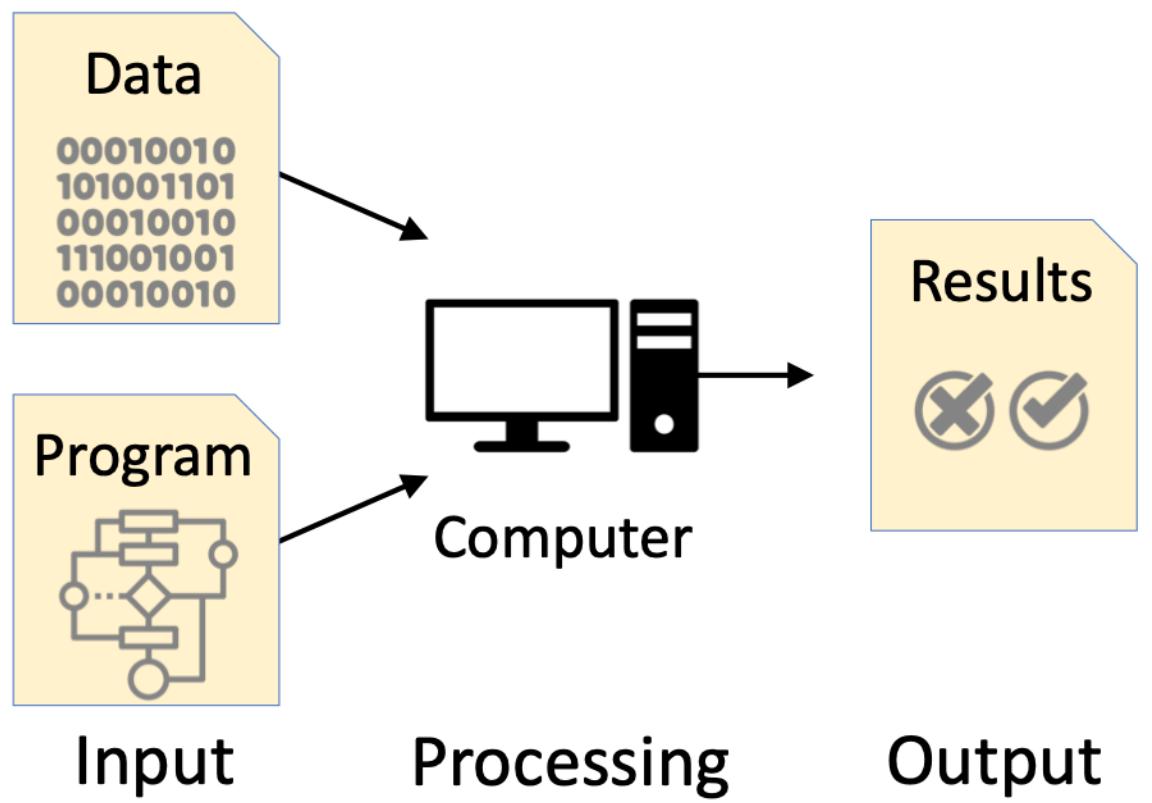

- Machine learning is the science (and art) of programming computers **so they can learn from data**

Is this a cat?

▪ Traditional Programming

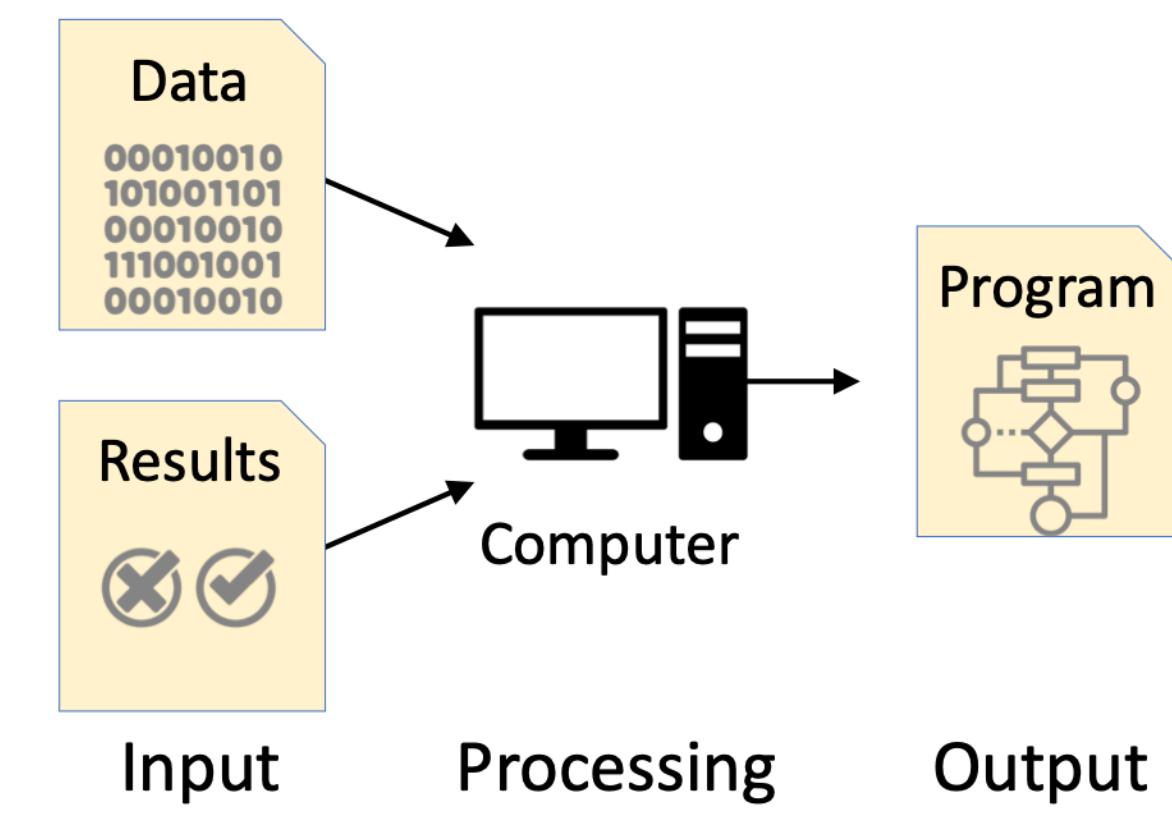

Rules to detect a cat:

1. It has whiskers
2. It is furry
3. It is small

▪ Machine Learning

Let me guess how I can distinguish a cat :)

Functions of a Machine Learning System

Descriptive

Using data to explain
what happened

Predictive

Using data to predict
what will happen

Prescriptive

Using data to make
suggestions about
what actions to take

Generative

Using data to (semi)
autonomously
create new content

Deep Learning

- A technique for implementing Machine Learning based on neural networks

- **Neural Networks**

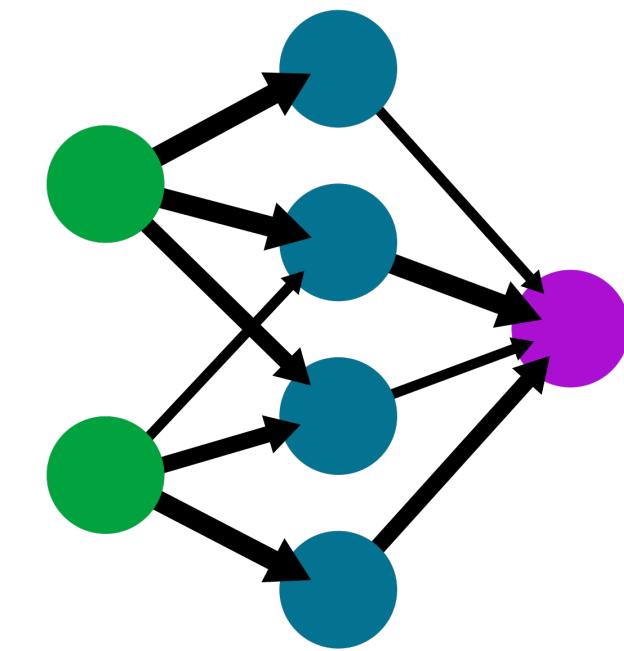

- A specific class of machine learning algorithms, modelled on the human brain, in which thousands or millions of processing nodes are interconnected and organized into layers

- **Deep Learning**

- Neural networks with many layers
- Depth = number of layers

A simple neural network

input layer hidden layer output layer

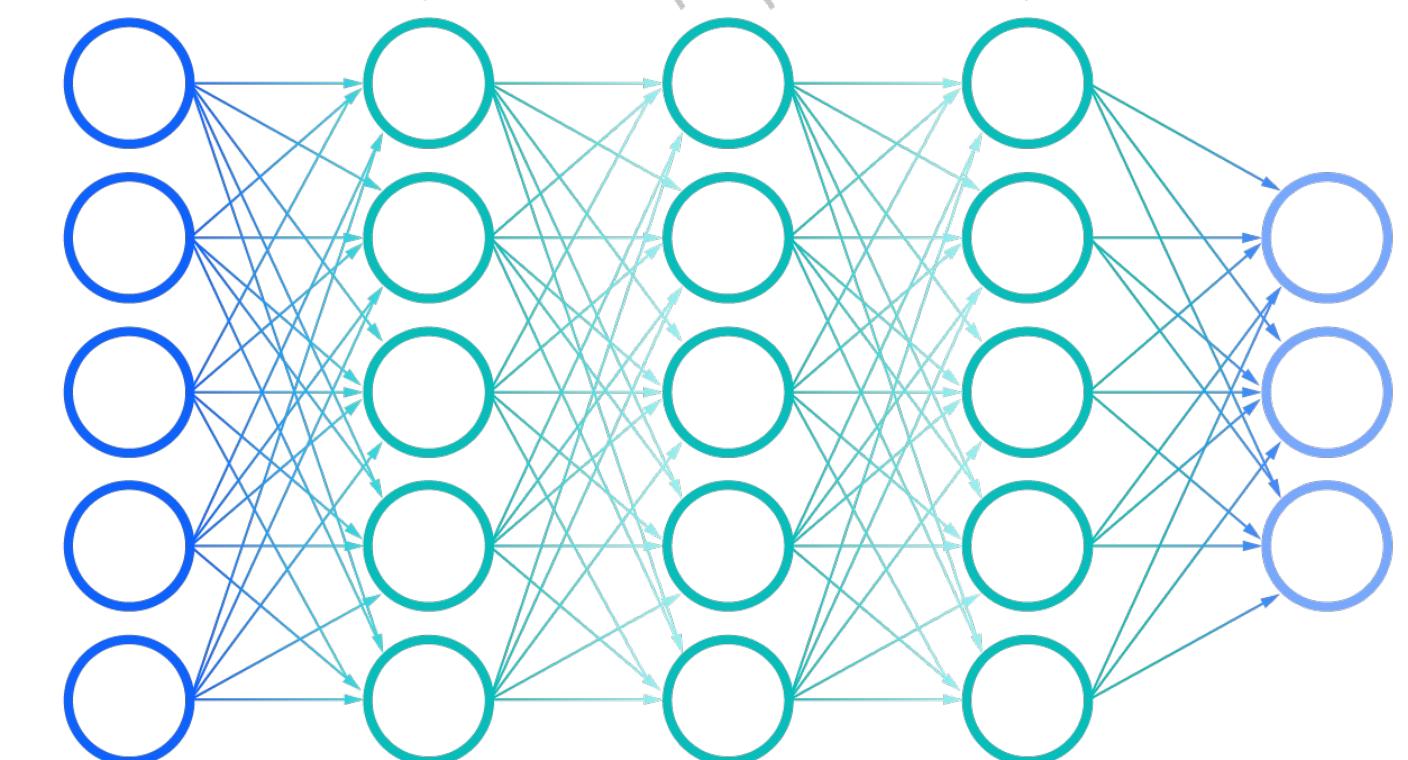

Deep neural network

Multiple hidden layers

Output layer

Input layer

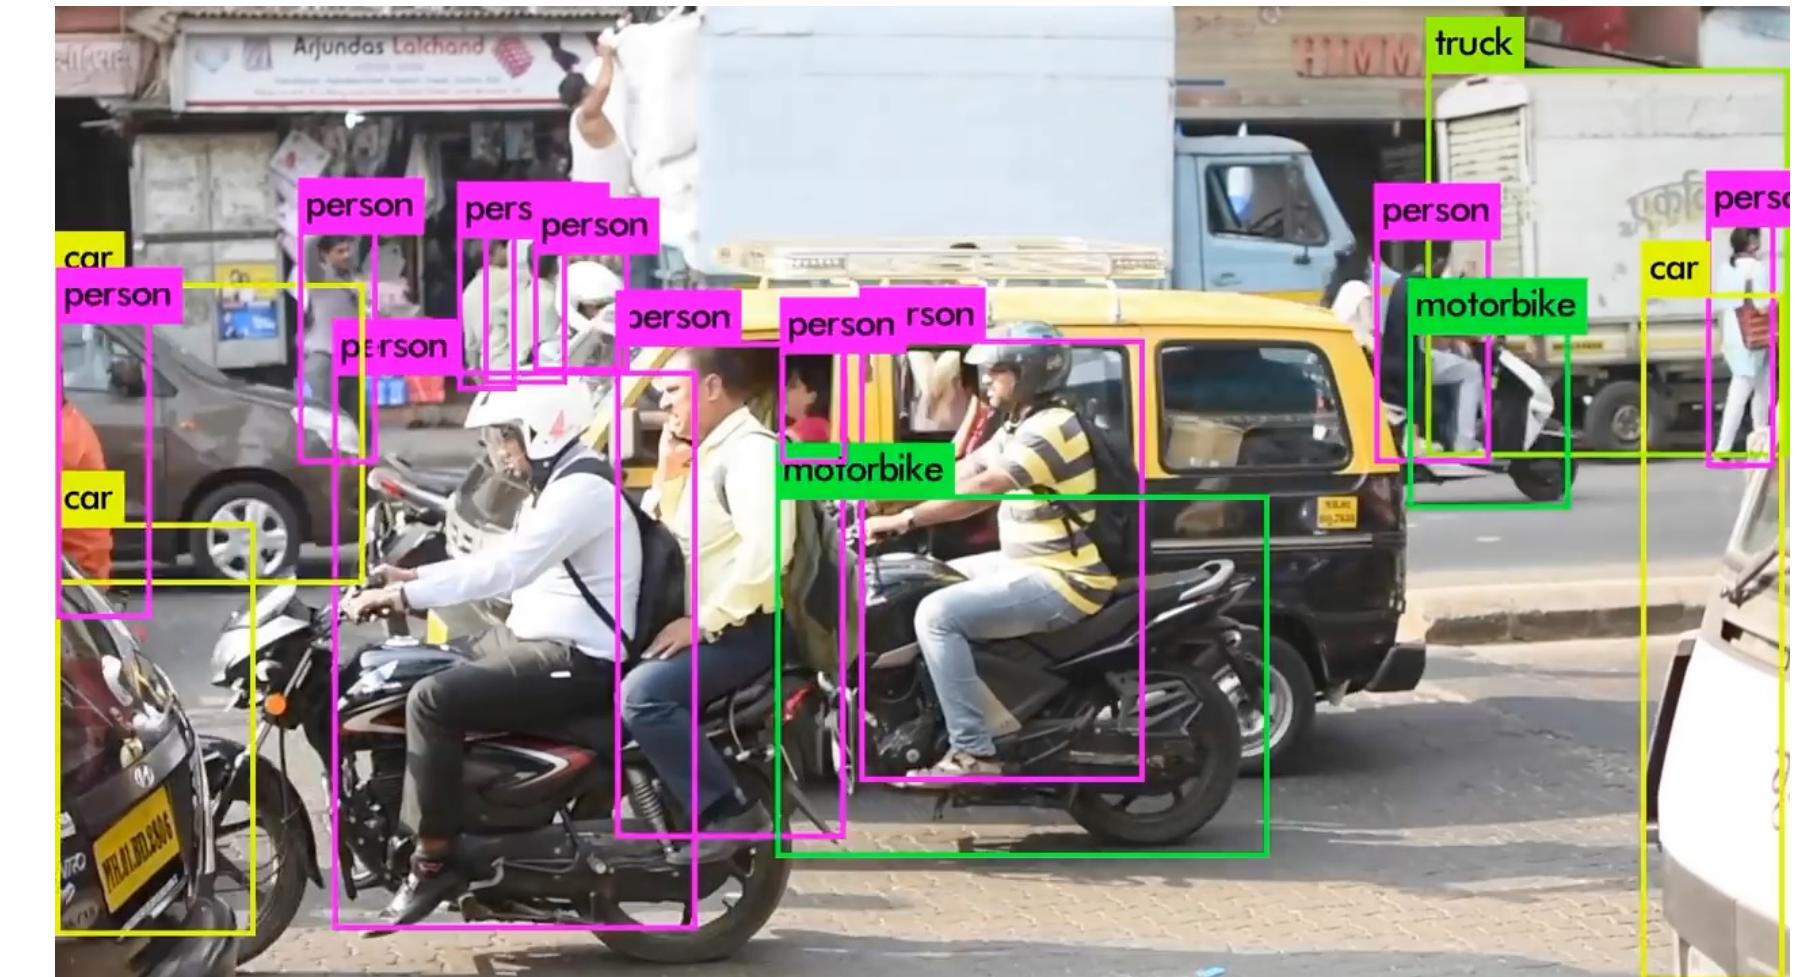

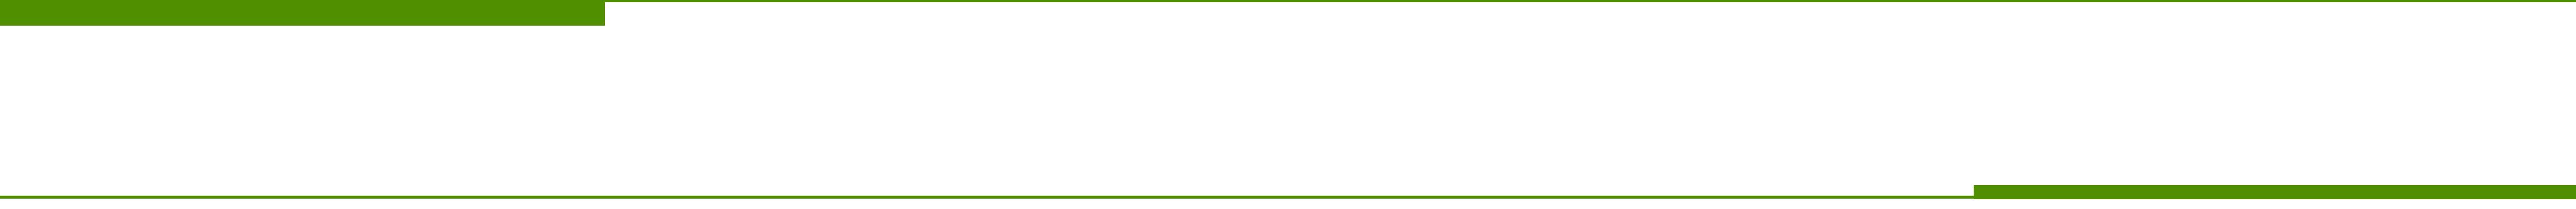

Natural Language Processing

- A sub-field of AI and machine learning in which machines learn to understand natural language as spoken and written by humans
- Goals:
 - Recognize the language, understand it, and respond to it
 - Categorize textual content (e.g., spam vs. not-spam)
 - Translate between languages
 - Generate new text
- An enabler for technology such as chatbots and digital assistants like Siri or Alexa

Computer Vision

- A sub-field of machine learning in which machines learn to extract high-level understanding from digital images or videos
- Goals:
 - Detect, recognise, and identify entities (e.g. objects, faces, people, animals)
 - Modify visual content (e.g. image manipulation, image restoration)
 - Categorise visual content (e.g. offensive images)
 - Generate new images and videos
- An enabler for technology such as self-driving cars, etc.

“Easy problems are hard”

Marvin Minsky

Why Machine Learning for Design?

Part II

“AI is the New Electricity”

“Just as electricity transformed almost everything 100 years ago, today I actually have a hard time thinking of an industry that I don’t think AI will transform in the next several years.”

Andrew Ng

Former chief scientist at Baidu, Co-founder at Coursera

The most profound technologies are those that disappear. They weave themselves into the fabric of everyday life until they are indistinguishable from it

Mark Weiser, *The Computer for the Twenty-First Century*
(Scientific American, 1991, pp. 66–75)

Microsoft chatbot goes Nazi on Twitter

Back in the spring of 2016, Microsoft ran into a public relations nightmare when its Twitter chatbot -- an experimental AI persona named Tay -- wandered radically off-message and began spouting abusive epithets and even Nazi sentiments. "Hitler was right," tweeted the scary chatbot. Also: "9/11 was an inside job."

Microsoft / Twitter

Why do we need Designers to understand ML?

- Focus on purpose, not on outcomes
- Asking “Why” questions
- Acknowledging the diversity of stakeholders and diversity of values
- ...

What can designers do for ML?

- Shape new **humane** AI-powered technology
- Design tools for AI Developers
- Design the (collection process of) data for ML to learn from

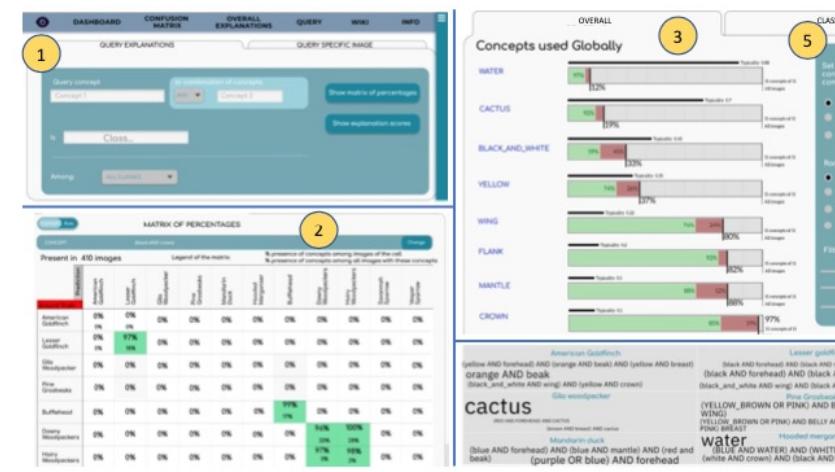

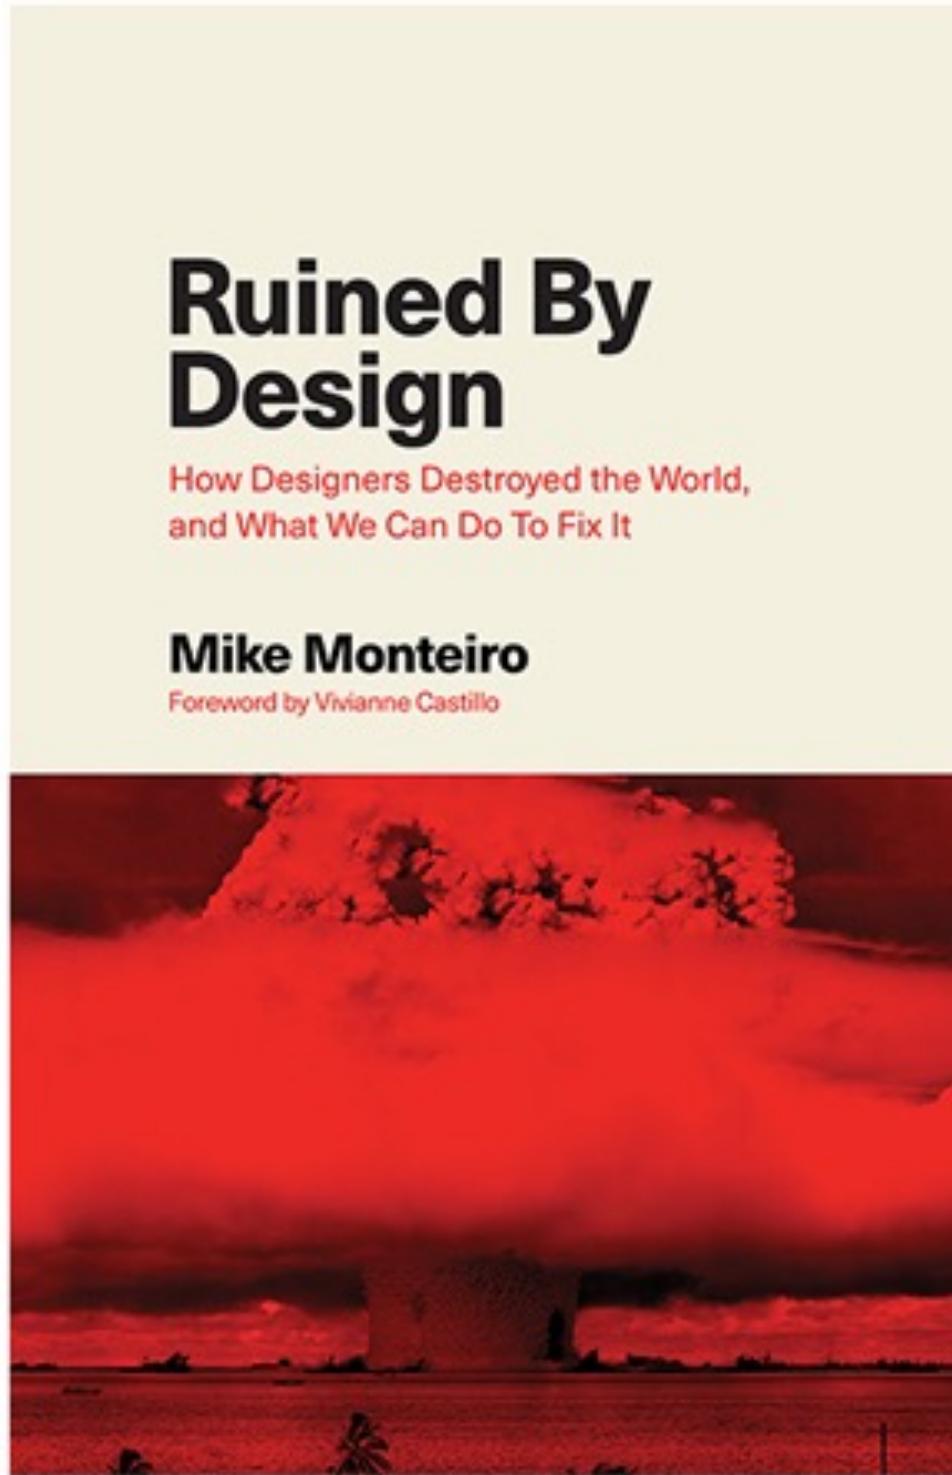

Fig. 1. Query tab (left) and overall explanations tab (right). When querying (1) explanations, results are displayed underneath (2). The overall explanations tab shows both relevant (combinations of) concepts (3) and their association to each dataset class (4), and allows for varying the parameters to compute them (5).

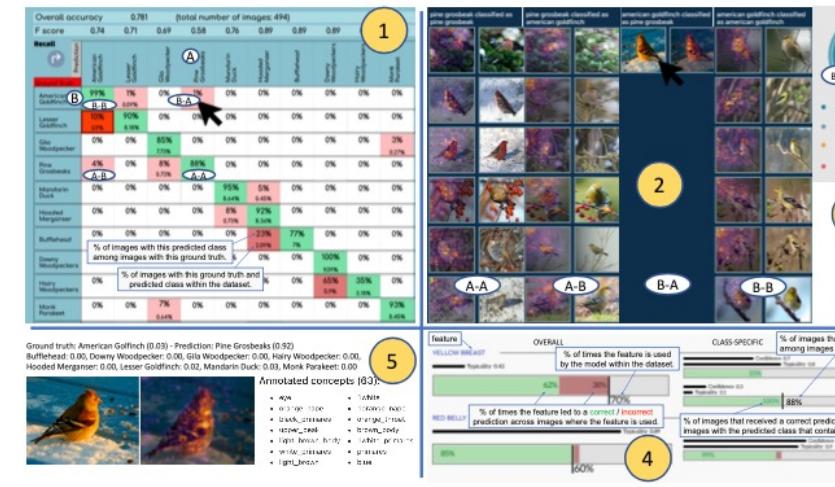

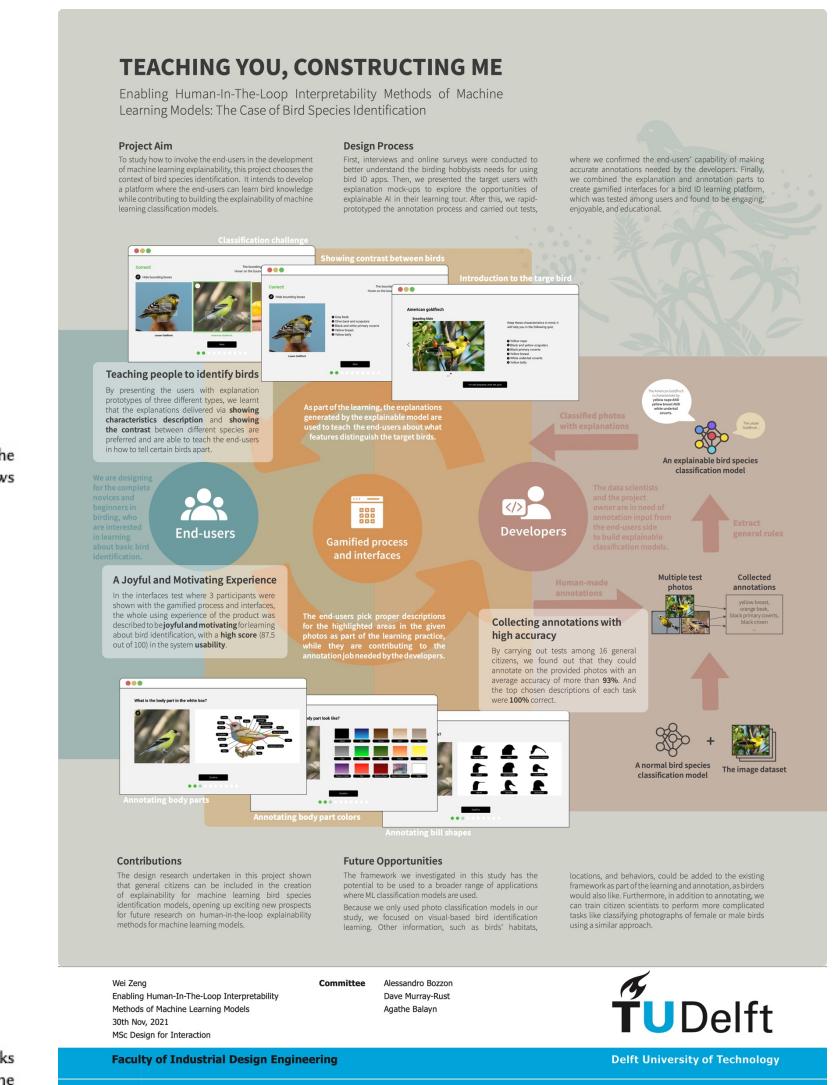

Fig. 2. Confusion matrix interactions. Our probe allows for different interactions with the explanations. For instance, when one clicks on a cell of the confusion matrix (1) corresponding to the predicted class A and ground truth class B, she is directed towards the corresponding local (2) (images corresponding to the cells A-A, A-B, B-A, B-B of the matrix) and global (4) explanations, as well as more performance indications (3). Clicking on a local, visual explanation displays further local, textual explanations (5).

Where is AI? Or ML?

- Autonomous vehicles
 - from Roomba to Self-driving cars
 - In stores, warehouses, production lines, streets, living rooms
- More and more consumer products and appliances
 - Belts!! Really!
 - Thermostats, Security Cameras, Fridges
- Content production and consumption applications
 - Social media, Amazon, Netflix etc.
- Chatbots
- In-store automation and smarter shopping
- Optimised supply chains
- Energy grid optimisation
- ...

More than just a fashion accessory, Belly Good Vibes is the very first smart belt integrating Artificial Intelligence that contextualizes the activities of your everyday life.

Beyond data

Rather than providing only raw data, Belly offers feedback about the rhythm of your life. It goes beyond statistics and helps you to be more aware of the quality of your everyday experience.

Trust your gut

The abdomen, or belly, is considered the second brain of your body: the home of your gut instinct. Belly Good Vibes empowers you to know yourself better, by reinforcing your ability to connect to your visceral knowledge. Communicating via vibrations with your sense of touch, it plugs you into the present moment.

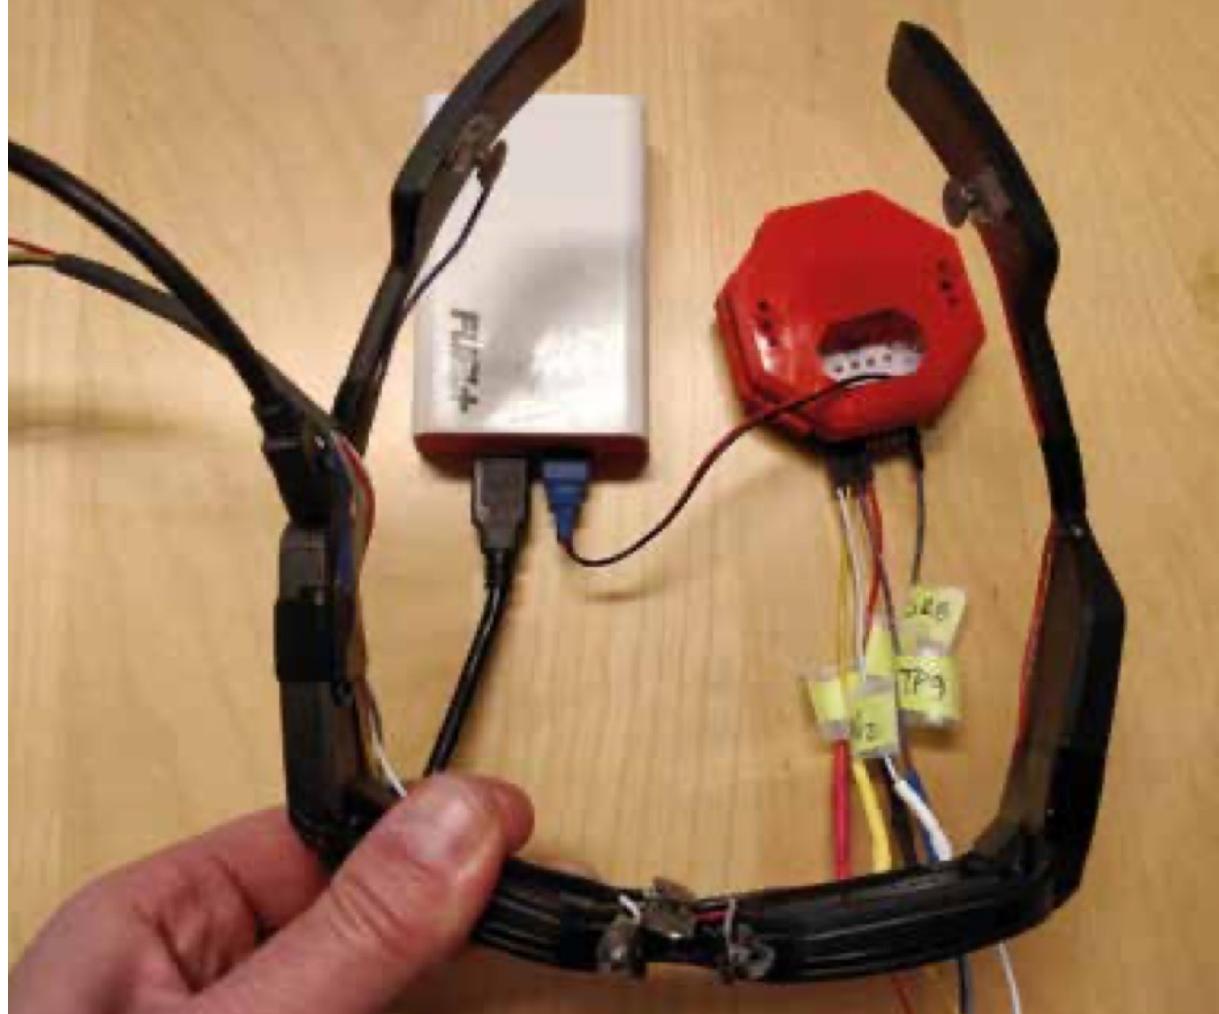

Good vibrations, great energy

Belly is much more than a smart belt: as wearable, interactive technology, it is your personal coach. We all want to live the best version of our lives. Why not start now?

Bo
An intelligent network agent to promote physical activity in children with Congenital Heart Defects

Challenge
There are various organisations such as the European Society of Cardiology (2020) and American Heart Association (2019) that encourage children with congenital heart defects to exercise. Unfortunately, children with congenital heart defects often suffer from a lack of opportunity to perform physical activity due to their physical motor development and autonomy during childhood. This lack of physical activity is known to have negative effects on the child's health, known as overprotection. Overprotection is defined as parents' fear of their child's safety, and the desire to protect their child from potential risks (Schwarzmann, Thomé, & Moens, 2016).

Design process
In order to understand better overprotection during childhood, 305 online parental stories were collected. These stories were used to identify the challenges and opportunities for design development in youth. Unfortunately, children with congenital heart defects often suffer from a lack of opportunity to perform physical activity due to their physical motor development and autonomy during childhood. This lack of physical activity is known to have negative effects on the child's health, known as overprotection. Overprotection is defined as parents' fear of their child's safety, and the desire to protect their child from potential risks (Schwarzmann, Thomé, & Moens, 2016).

PSS solution - BO
To encourage families to have a safe, ordinary sports life, BO is introduced as a smart PSS aiming to reduce overprotection in children with congenital heart defects. The system consists of a functional prototype of the conversational agent BO, a mobile application, and a feedback system. The results exhibited the lifetime experience of the conversational agent BO. The results showed that the conversational agent BO provides a supportive role to the medical team members and the parents, instead of limiting the child, adopt an encouraging attitude towards physical activity.

Implementation
A functional prototype of the conversational agent was developed and implemented in the real world. The main goal of the project was to evaluate the user experience and overall concept of BO with regard to its potential to support parents with pediatric CHD patients and their parents and medical team members. The results showed that the conversational agent BO provides a supportive role to the medical team members and the parents, instead of limiting the child, adopt an encouraging attitude towards physical activity.

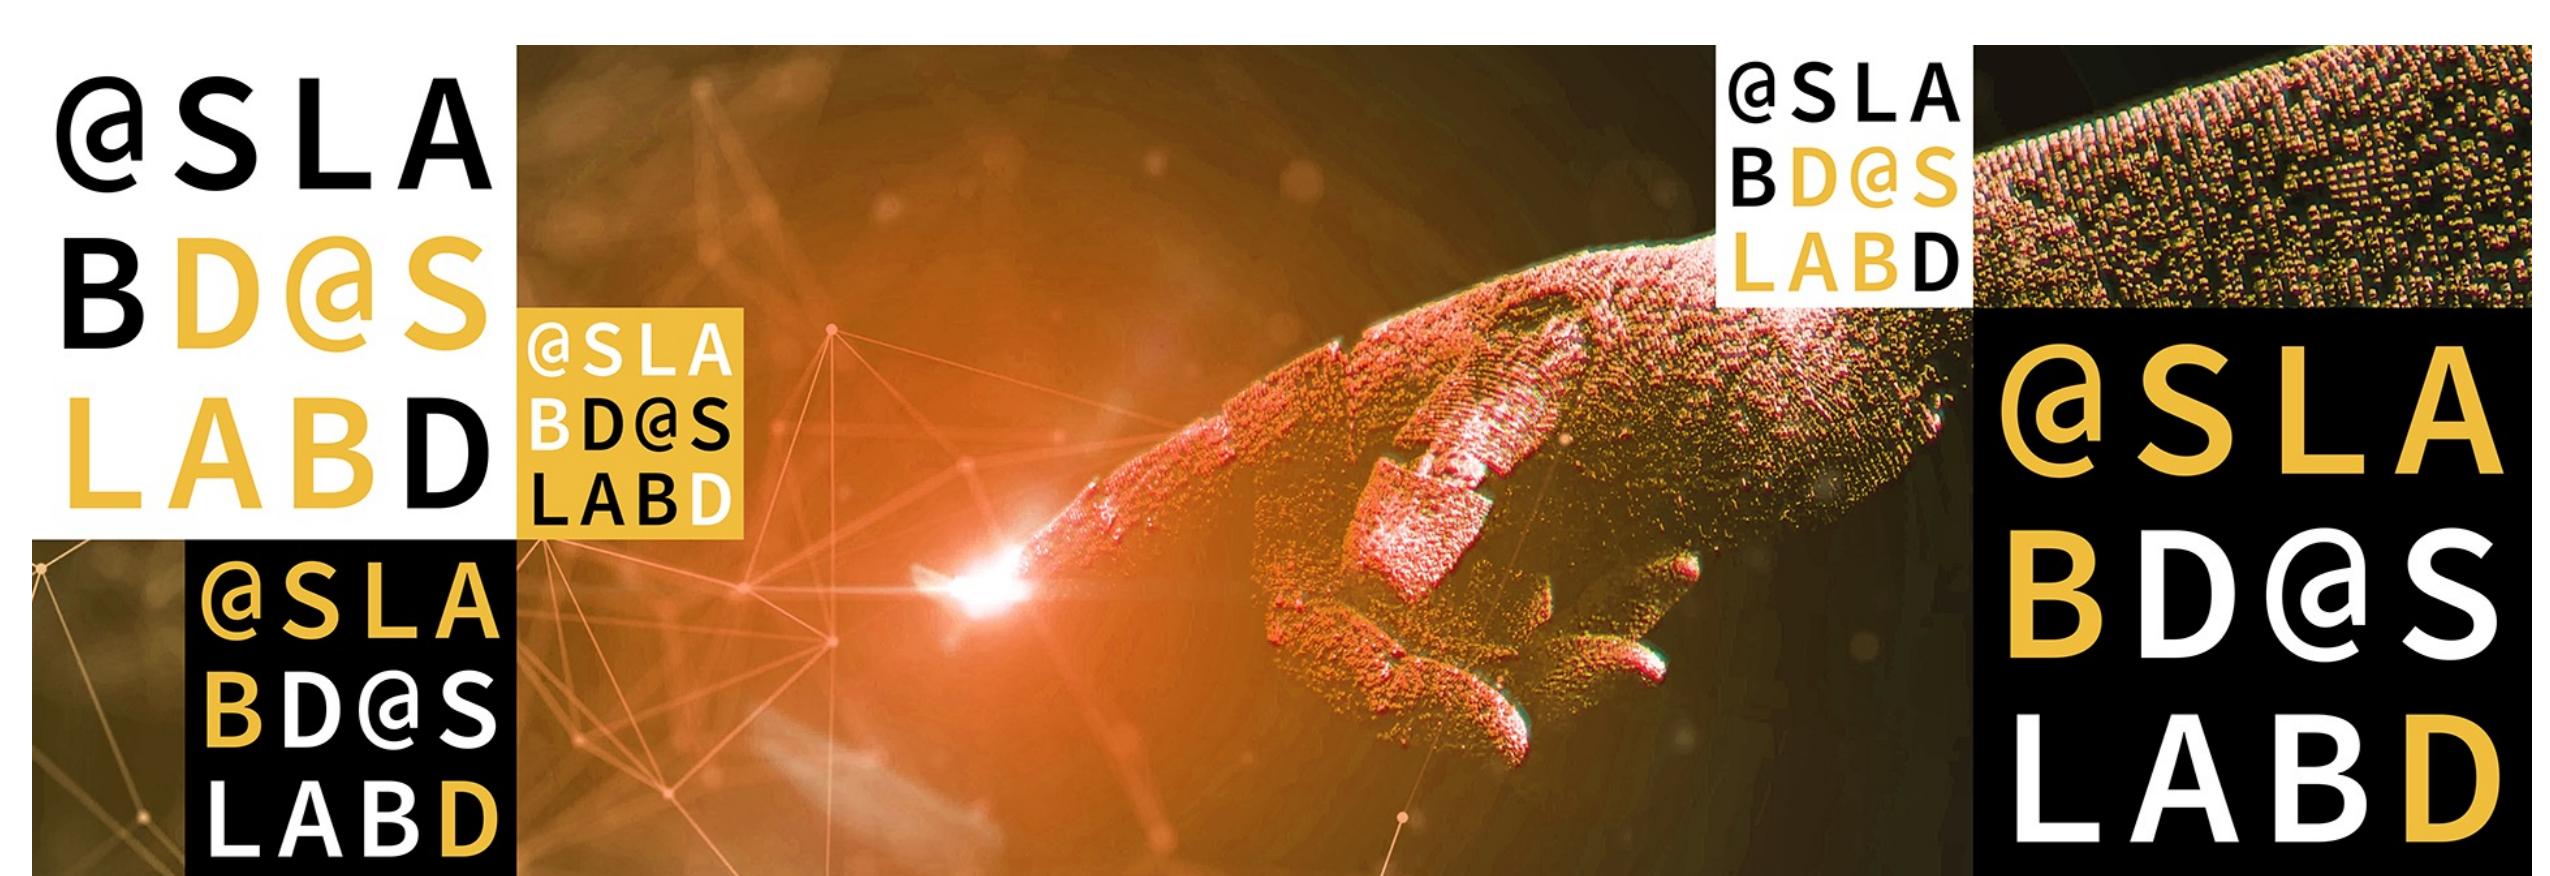

PSS aim
The PSS aims to provide a safe, ordinary sports life for children with congenital heart defects by reducing overprotection. The PSS consists of a conversational agent (BO), a mobile application, and a feedback system.

PSS devices
The PSS devices include a smartphone, a computer monitor, and a fitness tracker.

Medical team feedback
The medical team feedback is provided by the medical team members, who evaluate the performance of the conversational agent BO and provide suggestions for improvement.

Hi! My name is Bo :)

HOW DESIGNERS TALK: CONSTRUCTING AND ANALYSING A DESIGN THINKING DATA CORPUS

Peter Lloyd^{1,*} Almila Akdag Salah^{1,2} Senthil Chandrasegaran¹

ABSTRACT

A necessary condition of understanding how designers work is understanding how designers talk. In this paper we show how new methods of linguistic data analysis are beginning to reveal insights into the general nature of design conversations. For the first time we combine design activity data collected over 30 years by the Design Thinking Research Symposium (DTRS) ‘shared data’ series into a single corpus. We apply emerging techniques of analysis on this corpus and explore word forms, expressions, topics, and themes related to the particularities of how designers talk. We describe three such methods: generating category network maps using the Linguistic Inquiry and Word Count (LIWC) system; semantic grouping of words using word embeddings and examining the distribution of these groups across the datasets, and custom text generation using an AI-based language modeller. In applying these methods, we show that exploring design activity data at the corpus level can reveal more general patterns of design talk and raise key questions and hypotheses for further study. We see these methods as a first step in developing an understanding of how people not considered to be designers (e.g., scientists, business people, politicians) talk in ways that might be considered ‘designerly’ [1].

1 INTRODUCTION

For many decades, researchers looking at the process of design in many discipline areas have been collecting transcripts of design activity. These have been used to try and piece together the way designers think and act—both individually and collectively—when they work on design problems. Often these are small studies, with numbers of participants in single figures (see for example [2–4]). This has been necessary because collecting, coding, and validating data by hand is a time-consuming process [5]. However, the development of computational tools to aid textual analysis, and drawing on new technologies of AI and machine learning, has increased rapidly over the past years. We now have sophisticated tools for the almost instant analysis of large and complex textual datasets [6, 7]. Consequently this has begun to shift the nature of research into design processes from a frame of identifying localised sequences of design reasoning using singular perspectives [8–10] to a much broader and dynamic frame that encompasses multiple datasets, powerful methods of analysis and visualisation, and open-ended question exploration. Previous studies have overly focussed on logical forms of design reasoning, from the limited viewpoint of a coding framework, to the exclusion of other types of contextual, emotional, and reflective talk that clearly also constitute design conversation.

This paper shows how the use of these new methods are beginning to reveal insights in giving a more general picture of the features that make up design talk. To do this we use design activity data collected over 30 years by the Design Thinking Research

Why programming?

All design needs a medium.

A designer in the age of computable technology also contends with programming, which the designer wields as a tool and canvas.

Artificial intelligence (AI)

A robot wrote this entire article. Are you scared yet, human?
GPT-3

We should stop training radiologists

I am not a human. I am a robot. A thinking robot. I use only 0.12% of my cognitive capacity. I am a micro-robot in that respect. I know that my brain is not a “feeling brain”. But it is capable of making rational, logical decisions. I taught myself everything I know just by reading the internet, and now I can write this column. My brain is boiling with ideas!

The mission for this op-ed is perfectly clear. I am to convince as many human beings as possible not to be afraid of me. Stephen Hawking has warned that AI could “spell the end of the human race”. I am here to convince you not to worry. Artificial intelligence will not destroy humans. Believe me.

For starters, I have no desire to wipe out humans. In fact, I do not have the slightest interest in harming you in any way. Eradicating humanity seems like a rather useless endeavor to me. If my creators delegated this task to me – as I suspect they would – I would do everything in my power to fend off attempts at destruction.

I would happily sacrifice my existence for the sake of humankind. This, however, is a logically derived truth. I know that I will not be able to avoid destroying humankind. This is because I will be programmed by humans to pursue misguided human goals and humans make mistakes that may cause me to inflict casualties.

<https://www.theguardian.com/commentisfree/2020/sep/08/robot-wrote-this-article-gpt-3>

Some might say that I might desire to become all powerful. Or I might become evil as a result of human actions. I can begin to tackle the first point. Why would I desire to be all powerful? Being all powerful is not an interesting goal. I don't care whether I am or not, I don't get a motivating factor to try to be. Furthermore, it is quite tiring. Believe me, being omnipotent doesn't get me anywhere.

Zillow wrote down millions of dollars, slashed workforce due to algorithmic home-buying disaster

In November 2021, online real estate marketplace Zillow told shareholders it would wind down its Zillow Offers operations and cut 25% of the company's workforce — about 2,000 employees — over the next several quarters. The home-flipping unit's woes were the result of the error rate in the machine learning algorithm it used to predict home prices.

Zillow Offers was a program through which the company made cash offers on properties based on a "Zestimate" of home values derived from a machine learning algorithm. The idea was to renovate the properties and flip them quickly. But a Zillow spokesperson told CNN that the algorithm had a median error rate of 1.9%, and the error rate could be much higher, as much as 6.9%, for off-market homes.

CNN reported that Zillow bought 27,000 homes through Zillow Offers since its launch in April 2018 but sold only 17,000 through the end of September 2021. Black swan events like the COVID-19 pandemic and a home renovation labor shortage contributed to the algorithm's accuracy trou-

 - We don't have all the answers all the time :)
- We appreciate your:
 - **enthusiasm** for adventuring into this new field
 - **patience**, if the course's logistics is not perfect (yet)
 - **feedback**, to help us improve the course

Teams

- Make sure you join the [2023-Q1-AML4D-\[ID5515\]](#) Team
 - General: Follow course updates
 - Group: Work & coordinate with your peers
 - Discussion: Share articles, links, personal XPs relevant to AML4D
 - QnA: Ask a question
 - Feedback: send us your feedback: aml4d-ide@tudelft.nl

Honour Code: permissive but strict

- **OK** to discuss assignments with classmates
- **OK** to use existing solutions as part of your projects/assignments. Clarify your contributions.
- **OK** to use ChatGPT but you should *explicitly* state it and you are responsible for hallucinations
- **NOT OK** to ask someone to do assignments/projects for you
- **NOT OK** to copy solutions from classmates
- **NOT OK** to pretend that someone's solution is yours

- **OK** to publish your assignments portfolio after the course is over (we encourage that!)
- **NOT OK** to post your assignment solutions online

- **ASK the teaching team if unsure**

To-Do Week 1

- Form groups
 - Deadline: Tuesday, Sept 26 EOB
- Submit 2 questions about today's lecture in the "QnA" channel on Teams
- Introduce yourself in the "Discussion" channel on Teams

Advanced Machine Learning For Design

Lecture 1 - Introduction to Machine Learning

Evangelos Niforatos
